- System design
- Testing through RTCA(a 3rd party lab)
- Removal of radon and VOC in water

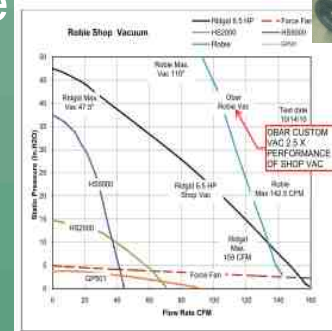

OBAR SYSTEMS

BUILDING DIAGNOSTICS

Sub Slab Depressurization Systems used for VOC remediation require diagnostic data to produce a cost effective design that meets the goals of the client.

With so much at stake it only makes sense to use the best equipment available. We use pressure differential monitors capable of reading values of .0001" WC. Where none existed we created our own series of diagnostic vacuums capable of outperforming stock vacuums by 250%. We have provided our services to Environmental firms, LSRP's and individual homeowners.

In 2010 OBAR set a precedent by being the first 3rd party contractor to be approved by both EPA and NJDEP to provide diagnostics and design services to the residents of Pompton Lakes NJ

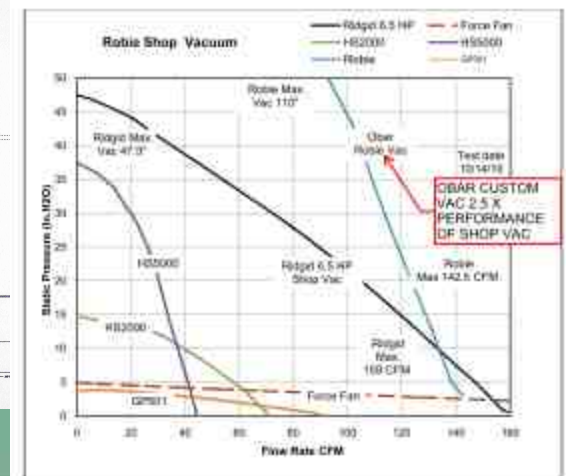

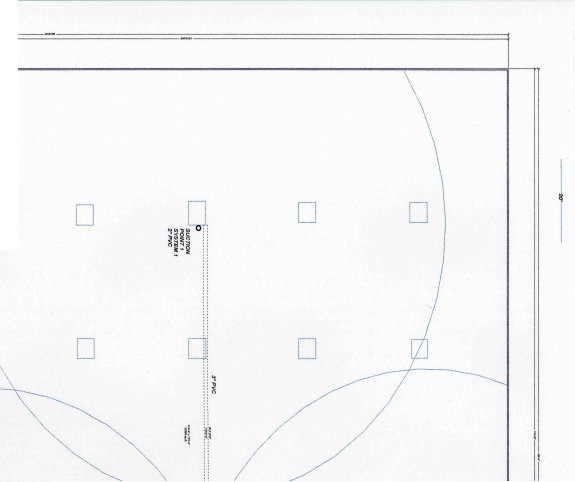

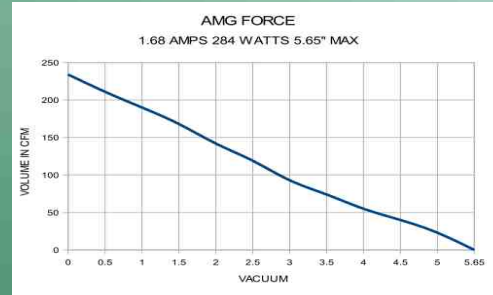

OBAR diagnostic VAC capable of 140 CFM and 120" WC 100% speed controlled dual stage motor with a built in pitot tube. OBAR uses a multistage filter system that reduces discharge contamination by 99.7%

OBAR SYSTEMS

CUSTOM DESIGN

OBAR can custom design a system to fit your needs. We have engineered and installed systems for a variety of buildings ranging from historic homes, to schools, to large commercial buildings.

- Diagnostics are performed with custom equipment designed and manufactured by OBAR.
- In house design and installation services.
- Guaranteed results.
- OBAR works with manufacturers to produce custom products for your designs.

OBARSYSTEMS

STABILITY AND TRUST

OBAR SYSTEMS was established in 1985. In 1987 we purchased our Rt 23 location, and as we grew we purchased an additional property on Oak Ridge Road. While many other companies have come and gone OBAR has thrived. When times were good we invested in the company and in tough times we weathered the storm by working hard and providing quality products and services at a fair price. You can count on us to be here and continue to be leaders in customer satisfaction.
